

# Introduction to Modules at CHPC

**Anita Orendt** 

**Assistant Director** 

Research Consulting & Faculty Engagement

anita.orendt@utah.edu

28 August 2018

## **Overview of Talk**

- Why Modules
- Where to find information
- How to setup to use modules
- Module basics
- Advanced Modules
- Demonstration

## What modules do

 Modules are a way of managing the user environment in an interactive session or a batch job

# **Why Modules**

- Modules lets users dynamically change the environment – including easily adding and removing directories needed for a given task from \$PATH etc – without needing to log out and back in
- Easy to switch between version of a package or application – again without having to start a new session
- Useful when packages have conflicts in their environment settings

# **Module Documentation at CHPC**

- https://www.chpc.utah.edu/documentation/software/modules.p hp
- https://www.chpc.utah.edu/documentation/software/modulesadvanced.php
- Video -- <a href="https://www.youtube.com/watch?v=Cu6C5INLDAY">https://www.youtube.com/watch?v=Cu6C5INLDAY</a>

## We make use of TACC's LMOD

- https://www.tacc.utexas.edu/research-development/taccprojects/lmod
- LUA based

# All accounts automatically use modules -

- This is done via the login scripts CHPC provides all accounts, even if you have older dot files
- CHPC uses modules to set up environments upon login: chpc/1.0

# Recommendations & Helpful Hints

- Keep both the cshell and bash versions in your home directory
- DO NOT make changes in the .tcshrc and .bashrc
- Use the .custom.csh/.custom.sh to load modules for programs regularly used in ssh sessions
- Use .aliases file to create aliases but do not set other environment variables in this file; if this file exists it will be sourced during login
- The software database mentions which installations have modules – if there is one you would like us to create, let us know!

#### CENTER FOR HIGH PERFORMANCE COMPUTING

### **Basic Module commands**

- module shows the list of module commands
- module load <name> loads module name (shortcut: ml <name>)
- module unload <name> unloads module name (ml -<name>)
- module avail shows a list of "available" modules (ml av)
- module list shows a list of loaded modules (ml)
- module help prints help for the module command
- module help <name> prints help for module
- module show <name> prints the module file
- module purge unload all modules
- module reset system resets to system default (only chpc module loaded)
- module swap <name1> <name2> swaps between two modules

#### CENTER FOR HIGH PERFORMANCE COMPUTING

# **CHPC Module Organization**

#### Core

 Contains modules for applications independent of both the compiler and MPI implementation

# Compiler

 Contains modules for applications dependent on a compiler (& version) but not on a MPI implementation

#### MPI

 Contains modules for applications dependent on both a compiler and a MPI implementation

Modules themselves are named by application name/version

# **Recent Changes**

- No longer allowed to have multiple compilers loaded
  - If you have intel loaded, and load any gcc it will unload intel
  - As a result we no longer have compiler tag as part of the module name in libraries and applications that are compiler dependent (ex – mpich, openmpi, netcdf, fftw)
- Parallel versions of boost, HDF5 have separate modules
  - hdf5 for module for serial build, phdf5 for module for parallel build
  - boost for serial, phoost for parallel

#### CENTER FOR HIGH PERFORMANCE COMPUTING

# Default, aliases, and hidden modules

- For some applications have a default module one that is installed if you do not provide a specific version
  - typically the latest version is specified to be the default
- For some modules, especially those with long version names, there is also an alias defined
  - ml intel/17 loads the default 2017 intel
  - ml intel/17.0 loads the 2017.0.098 version
- With move to CentOS7 we have depreciated older installations and their modules so some have been hidden
  - module --show\_hidden avail

# Module avail command

- "module avail" shows all modules available based on already loaded module
  - This also marks default (D), already loaded (L), and aliases
- Some modules are dependent on other modules based on organization
  - these modules are not listed unless the modules they depend on are loaded

# Module spider command

- "module spider" shows all modules, including modules that aren't available
- Use "module spider <string>" to see a subset of modules with string in name, and how to either load the module or how to get more detailed information on how to load

# Module show command

- Format module show modulename/version
- Shows you the content of the module file
- This is useful if there is information on running the program included in the module

## **Advanced Modules**

- Users can create "save lists" for commonly needed environments
- Users can write and use their own modules, creating modules for their own installations
- Contact CHPC if you need assistance doing this

# **Getting Help**

- CHPC website
  - www.chpc.utah.edu
    - Getting started guide, cluster usage guides, software manual pages, CHPC policies
- Service-Now issue/incident tracking system
  - Email: <u>helpdesk@chpc.utah.edu</u>
- Help Desk: 405 INSCC, 581-6440 (9-5 M-F)
- We use <a href="mailto:chpc-users@lists.utah.edu">chpc-hpc-users@lists.utah.edu</a> for sending messages to users; also have Twitter accounts for announcements -- @CHPCOutages & @CHPCUpdates
